

PROJECT DESIGN PHASE

Proposed Solution

Date	30 September 2026
Team ID	SWTID-2026-9596
Project Name	Implement Client Script and UI Policy
Phase Name	Proposed Solution
Maximum Marks	2 Marks

Proposed Solution:

Implement Client Scripts and UI Policies in ServiceNow to automate form validation and provide dynamic control of form fields. The solution will respond to user actions and predefined conditions so that relevant fields can be shown, hidden, made mandatory, or set to read-only when required.

Client Script:

Use Client Scripts to perform client-side actions such as validating user input and responding to form events. This helps provide immediate feedback and improves the accuracy of information entered by users.

UI Policy:

Use UI Policies to control the behaviour of form fields based on specified conditions. Fields can be made mandatory, visible/hidden, or read-only according to the selected conditions.

How the Solution Works:

1. User opens or updates a ServiceNow form.
2. The defined condition is checked.
3. The Client Script performs the required client-side validation or action.
4. The UI Policy changes the required field properties based on the condition.
5. The user receives a controlled and consistent form-entry experience.

Expected Benefits:

- Reduces incomplete and invalid data entry.
- Provides dynamic and user-friendly forms.
- Reduces unnecessary manual validation.
- Improves data quality and consistency.
- Makes the ServiceNow form easier to use.

Expected Outcome:

A dynamic ServiceNow form where Client Scripts handle client-side validation and UI Policies automatically control field visibility, mandatory status, and read-only status according to defined business conditions.
