

PROJECT DEVELOPMENT PHASE

ARTIFICIAL INTELLIGENCE

Model Performance Test / Intelligent Automation Validation

Date	30 September 2026
Team ID	SWTID-2026-9596
Project Name	Implement Client Script and UI Policy
Maximum Marks	As per project evaluation

Model Performance Testing:

This section documents the Artificial Intelligence phase for the project "Implement Client Script and UI Policy". The project focuses on intelligent form automation and dynamic validation in ServiceNow using Client Scripts and UI Policies. Since the core implementation is rule-based form automation rather than a separately trained machine-learning model, conventional training and validation accuracy are not applicable.

The following information can be used by the project team in the model/performance testing template to record functional performance, validation behavior, and automation results.

S.No.	Parameter	Values	Screenshot
1	Model Summary	Intelligent form automation using ServiceNow Client Scripts and UI Policies. Client Scripts perform client-side field validation and dynamic actions, while UI Policies control field visibility, mandatory status, and read-only behavior based on conditions.	Attach implementation screenshot
2	Accuracy – Training Accuracy	Not Applicable (N/A) – no machine-learning model is trained in this project. Functional rules are configured and tested instead.	Attach test/configuration screenshot
	Validation Accuracy	Not Applicable (N/A) – validation is measured through functional test cases and expected form behavior.	Attach validation screenshot
3	Fine Tuning Result (if Done)	Rule refinement performed by reviewing Client Script conditions, UI Policy conditions, field behavior, and validation messages. No ML fine-tuning is performed.	Attach updated configuration screenshot
	Validation Accuracy	Functional validation result: expected Client Script and UI Policy behavior should occur for the defined test conditions. Record the final pass/fail result after execution.	Attach final test-result screenshot

Functional Test Summary

Test Case	Expected Result	Actual Result	Status
Client Script field validation	Invalid/required input is handled according to the configured script.	To be filled after execution	Pending
UI Policy mandatory control	Field becomes mandatory when the defined condition is true.	To be filled after execution	Pending
UI Policy visibility control	Configured field is shown/hidden according to the condition.	To be filled after execution	Pending

UI Policy read-only control	Configured field becomes read-only when the condition is true.	To be filled after execution	Pending
Combined Client Script + UI Policy	Form behavior remains consistent without conflicting rules.	To be filled after execution	Pending

Conclusion

The Artificial Intelligence phase documents the performance and validation approach for the project. The solution does not use a separately trained AI/ML model; therefore, training accuracy and validation accuracy are recorded as N/A. Project success is evaluated through functional testing of Client Scripts, UI Policies, field validation, and dynamic form behavior.
