

Ideation Phase: Empathize & Discover

Date	30 September 2026
Team ID	SWTID-2026-9596
Project Name	Automation and Dynamic Form Validation using ServiceNow Client Scripts and UI Policies
Maximum Marks	4 Marks

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes. It is a useful tool to help teams better understand their users. Creating an effective solution requires understanding the true problem and the person who is experiencing it. The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

1. What does he THINK AND FEEL?

- Major preoccupations: Wants forms to load instantly without unnecessary lag or server postbacks.
- Worries & Aspirations: Worried about entering invalid configuration dates or missing required fields that stall operations.
- What really counts: Hopes to see an automated interface that guides form data validation natively in the browser.

2. What does he HEAR?

- What bosses say: "Ensure high data accuracy in Incident and Change logs to avoid breaking business SLA targets."
- What peers/friends say: "Filling out manual forms with zero client-side guidance is tedious and causes operational errors."
- What influencers say: "ServiceNow modern UI execution should favor client-side rules over heavy backend scripting to save bandwidth."

3. What does he SEE?

- Environment: Complex multi-field forms (Incident, Asset, Change Management tables) containing unorganized grids.
- Market offers: Modern low-code environments that hide or show input boxes interactively based on choices.
- Competitor setups: Dynamic layouts that strictly grey out locked or closed tickets smoothly without reloads.

4. What does he SAY AND DO?

- Public attitude: Always double-checks inputs manually because the forms lack real-time helper tooltips.
- Behavior towards others: Shares spreadsheets and manual checklists with teammates to bypass system form traps.
- Appearance/Action: Spends extra time auditing field changes manually before pressing the submit transaction button.

5. PAIN (Fears, Frustrations, Obstacles)

- Frustrations: Static forms displaying fields that are completely irrelevant to the selected priority or category.
- Obstacles: Accidentally picking past implementation dates because the system doesn't throw immediate browser validation blocks.
- Fears: Submitting data with missing mandatory logs, leading to ticket rejection loops by server business rules.

6. GAIN (Wants, Needs, Measures of Success)

- Wants & Needs: Seamless client-side validation that stops bad submissions and adjusts form layout rules automatically.
- Measures of Success: Drastic reduction in manual script errors, faster average ticket handling times, and a highly responsive UX.
