

Project Design Phase Solution Architecture

Date	30 September 2026
Team ID	SWTID-2026-9596
Project Name	Implement client script and UI policy
Maximum Marks	4 Marks

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Solution Architecture Diagram:

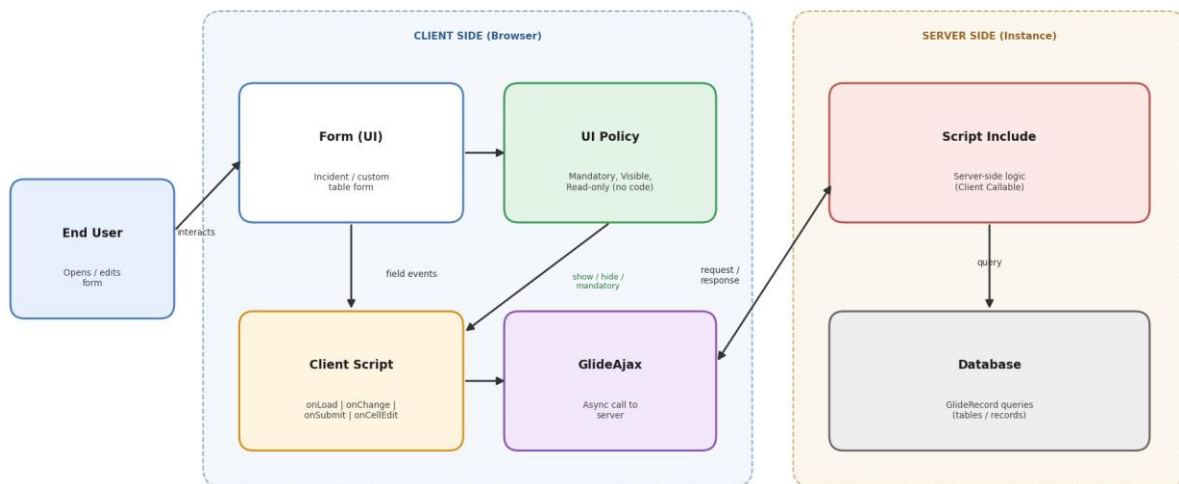

Figure 1: Architecture and data flow of client script and UI policy implementation

Key Components:

- UI Policy – declaratively controls field behavior (mandatory, visible, read-only) on the form without scripting.
- Client Script – runs in the browser on form events (onLoad, onChange, onSubmit, onCellEdit) for validation and dynamic behavior.

- GlideAjax – asynchronous call from the client script to fetch server-side data without reloading the form.
- Script Include (client callable) – reusable server-side logic that processes the request and returns the result.
- Database (GlideRecord) – tables and records queried by the Script Include to supply the required data.
