

Implement Client Script and UI Policy (Incident)

Based on observations and feedback from the ServiceNow Incident Management team

SCENARIO	Entice	Enter	Engage	Exit	Extend
	How does someone initially become aware of this need?	What do people experience as they begin the work?	In the core moments of the work, what happens?	What do people typically experience as the work finishes?	What happens after the work is over?
Creating, testing, and releasing a Client Script and UI Policy on the Incident form	Receive the requirement	Open UI Policies	Open a new Incident	Fix any issues	Watch real incidents
	A business user or manager asks for a change on the Incident form	Go to System UI > UI Policies and click New	Load the form and check that the rules work on load	Check the browser console for script errors	Check that agents fill the form correctly
	Review the current form	Set the condition	Change field values	Add to an Update Set	Collect feedback
	Open a test Incident and see which fields need rules	Example: Category is Hardware	Change Category and Priority and watch the form react	Capture the UI Policy and Client Script records	Ask service desk agents if the form is easy to use
	Choose the right tool	Add UI Policy Actions	Test the script	Get approval and move	Improve and reuse
	UI Policy for show, hide, mandatory, read-only. Client Script for custom logic	Make Configuration item mandatory and visible	Confirm messages appear and Save is blocked when needed	Peer review, then move to Test and Production	Update rules and reuse the pattern on other forms
		Create a Client Script			
		Go to System Definition > Client Scripts, table = Incident, type = onChange			
Interactions What interactions do they have at each step along the way? People: Who do they see or talk to? Places: Where are they? Things: What digital touchpoints or physical objects would they use?	People	People	People	People	People
	Requester, Incident manager, ServiceNow Admin	ServiceNow Developer or Admin	Developer and a tester	Peer reviewer, Release manager	Service desk agents, Process owner
	Places	Places	Places	Places	Places
	Email, chat, or a Story in the project tool	Filter Navigator in the ServiceNow instance	Development instance (sub-production)	Update Set list and instance comparison	Production Incident form
	Things	Things	Things	Things	Things
	Incident form and requirement note	UI Policy form, UI Policy Actions, Script editor	Incident form, browser console, test user	Update Set, change request, test results	Incident reports, feedback notes
Goals & motivations At each step, what is a person's primary goal or	Help me understand what the business really needs	Help me set the condition correctly the first time	Help me confirm that the form behaves as expected	Help me move my work safely to production	Help me see that agents are happy with the form
	Help me pick the simplest solution			Help me avoid missing any records	

SCENARIO	Entice	Enter	Engage	Exit	Extend
	Creating, testing, and releasing a Client Script and UI Policy on the Incident form				
	How does someone initially become aware of this need?	What do people experience as they begin the work?	In the core moments of the work, what happens?	What do people typically experience as the work finishes?	What happens after the work is over?
motivation? ("Help me..." or "Help me avoid...")		Help me write a script that is short and clear	Help me find errors before users do		Help me keep the rules easy to maintain
Positive moments What steps does a typical person find enjoyable, productive, fun, motivating, delightful, or exciting?	Clear rules make it easy to decide the tool	UI Policies are easy to build	It is satisfying to see the form change	Update Sets keep changes together	Agents fill better data
	UI Policy needs no code, so it is quick to start	Point-and-click actions, no scripting needed	Fields appear, hide, or become mandatory as planned	Easy to track and move	Fewer empty or wrong fields in Incidents
		Instant result			Better reports
		Changes show up on the form right after saving			Cleaner data helps the team
Negative moments What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?	Requirements are sometimes unclear	Wrong condition	Script errors	Forgotten records	Agents feel too many mandatory fields
	Not sure which fields should be mandatory	A small mistake in the condition breaks the rule	Hard to find the problem without console knowledge	Sometimes a record is left out of the Update Set	Can slow down urgent incidents
	Confusion between the two	Order of execution	Not working on mobile or List view	Long review time	
	Both can make a field mandatory, so people mix them up	UI Policy and Client Script can fight each other	Rules may act differently there	Waiting for approval delays the release	
Areas of opportunity How might we make each step better? What ideas do we have? What have others suggested?	Create a simple checklist to choose between UI Policy and Client Script	Use UI Policy first and script only when needed	Prepare a standard test case list for the Incident form	Use one Update Set per feature	Ask agents for feedback every quarter
	Share a short requirement template	Add clear names and comments to every record	Use the Script Debugger and console tips guide	Add a release checklist	Build a reusable library of common rules
