

PROJECT DESIGN PHASE

Problem – Solution Fit Template

Date	30 September 2026
Team ID	SWTID-2026-9596
Project Name	Implement Client Script and UI Policy
Phase Name	Project Design Phase
Maximum Marks	2 Marks

Problem – Solution Fit: The project addresses the problem of manual and inconsistent form validation in ServiceNow. Users may enter incomplete or incorrect information, while unnecessary fields can remain visible or editable. Client Scripts and UI Policies are used to provide dynamic form behaviour, validate inputs, and control field visibility, mandatory status, and read-only status according to the selected conditions.

Problem Identified:

- Form fields may not be validated immediately when users enter information.
- Some fields may need to become mandatory only under specific conditions.
- Unnecessary fields can make the form difficult to use.
- Manual validation can lead to incomplete or incorrect records.

Proposed Solution:

Implement Client Scripts and UI Policies in ServiceNow to make the form dynamic and user-friendly. Client Scripts can validate user input and respond to form events, while UI Policies can dynamically make fields mandatory, read-only, or visible/hidden based on defined conditions.

Purpose:

- Reduce incorrect or incomplete form submissions.
- Improve the user experience through dynamic form behaviour.
- Automatically control field visibility, mandatory status, and read-only status.
- Provide immediate validation and feedback to users.
- Improve data quality and consistency in ServiceNow records.

Problem–Solution Fit:

The identified problem is the need for accurate data entry and condition-based form behaviour. The proposed Client Script and UI Policy implementation directly addresses this need by automating validation and field behaviour. This creates a better fit between the user's form-entry requirements and the ServiceNow solution.

Expected Outcome:

A ServiceNow form that responds dynamically to user actions, validates required information, and displays or controls fields according to predefined conditions.
