

PROJECT DOCUMENTATION

Project: Implement Client Script and UI Policy

Phase Name: Project Documentation

1. INTRODUCTION

1.1 Project Overview

The project “Implement Client Script and UI Policy” focuses on developing a dynamic and user-friendly form using ServiceNow. Client Scripts and UI Policies are used to control form behavior, validate user inputs, and dynamically show, hide, enable, or make fields mandatory based on specific conditions.

1.2 Purpose

The main purpose of this project is to improve form usability and data accuracy by implementing client-side automation. The system reduces manual work and ensures that users enter the required information correctly.

2. IDEATION PHASE

2.1 Problem Statement

In a ServiceNow form, users may enter incomplete or incorrect information. Some fields may need to become mandatory, visible, or read-only depending on the values selected in other fields. The project addresses the need for dynamic form validation and field control.

2.2 Empathy Map Canvas

Category	Details
Think & Feel	Users want a simple and easy-to-use form.
See	Different fields and options in the ServiceNow form.
Hear	Instructions and validation messages from the system.
Say & Do	Enter information and submit the form.
Pain Points	Missing information, incorrect entries, and unnecessary fields.
Needs	Clear validation and dynamically controlled fields.

2.3 Brainstorming

- Use Client Scripts for client-side validation.
- Use UI Policies to control field visibility.
- Make fields mandatory based on conditions.
- Make fields read-only when required.
- Hide unnecessary fields.
- Display appropriate messages for invalid inputs.
- Improve the overall user experience.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

Stage	User Activity	System Response
Form Opening	User opens the form	Form loads with default settings
Data Entry	User enters details	Client Script validates input
Field Selection	User selects an option	UI Policy checks the condition
Validation	User changes values	Fields are dynamically updated
Submission	User submits the form	Required information is checked
Completion	Valid data is submitted	Form is successfully processed

3.2 Solution Requirement

1. Validate user input using Client Scripts.
2. Dynamically control fields using UI Policies.
3. Make required fields mandatory when necessary.
4. Show or hide fields based on conditions.
5. Make fields read-only when required.
6. Reduce incorrect or incomplete data entry.
7. Provide a simple and user-friendly interface.

3.3 Data Flow Diagram

User → ServiceNow Form → Client Script / UI Policy → Validation & Field Control → Updated Form → Submit

3.4 Technology Stack

Technology	Purpose
ServiceNow	Development platform
Client Script	Client-side validation and automation
UI Policy	Dynamic field control
JavaScript	Client-side scripting
ServiceNow Form	User interface
Web Browser	Accessing the application

4. PROJECT DESIGN

4.1 Problem Solution Fit

The identified problem is incomplete, incorrect, or unnecessary data entry in ServiceNow forms. The proposed solution uses Client Scripts and UI Policies to dynamically validate inputs and control form fields. This provides immediate feedback to users and improves the accuracy of submitted information.

4.2 Proposed Solution

The proposed system consists of a Client Script for client-side validation and automation, a UI Policy for dynamically changing field properties such as visibility, mandatory status, and read-only status, and a ServiceNow Form for user interaction.

Working Flow: User Input → Client Script Validation → UI Policy Condition → Field Property Update → Form Submission

4.3 Solution Architecture

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

Phase	Activity
Phase 1	Identify the problem
Phase 2	Analyse requirements
Phase 3	Design the solution
Phase 4	Create ServiceNow form
Phase 5	Implement Client Script
Phase 6	Implement UI Policy
Phase 7	Perform testing
Phase 8	Document results

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing

Test Case	Expected Result	Status
Open ServiceNow form	Form loads correctly	Pass
Enter valid data	Data is accepted	Pass
Enter invalid data	Validation is triggered	Pass
Select condition	UI Policy changes fields	Pass
Required field left empty	User is prompted to enter data	Pass
Field condition changes	Field visibility/state updates	Pass
Submit valid form	Form is submitted successfully	Pass

7. RESULTS

7.1 Output Screenshots

Insert the actual project screenshots in this section:

- ServiceNow Form – Initial View
- Client Script Configuration
- UI Policy Configuration
- Form with Dynamic Field Changes
- Validation Result
- Final Successful Form

8. ADVANTAGES & DISADVANTAGES

Advantages

- Improves data accuracy.
- Provides immediate validation.
- Reduces unnecessary user input.
- Creates dynamic forms.
- Improves user experience.
- Reduces manual checking.
- Makes the form easier to use.

Disadvantages

- Requires knowledge of ServiceNow.
- Incorrect scripting may cause validation issues.
- Complex conditions may require additional configuration.
- Client-side validation depends on proper browser-side execution.

9. CONCLUSION

The project “Implement Client Script and UI Policy” demonstrates how ServiceNow can be used to create dynamic and user-friendly forms. Client Scripts provide client-side validation and automation, while UI Policies control field properties based on specific conditions. Together, they help improve data quality, reduce errors, and provide a better user experience.

10. FUTURE SCOPE

- Add more advanced validation rules.
- Integrate server-side validation.
- Connect the form with external systems.
- Add automated notifications.
- Implement more complex UI conditions.
- Use Flow Designer for workflow automation.
- Add advanced reporting and analytics.

11. APPENDIX

Source Code (if any)

Add the Client Script JavaScript code used in the project here.
